Anterior Watson Jones Total Hip Arthroplasty System

Instrument system specifically designed for Direct Anterior approach THR

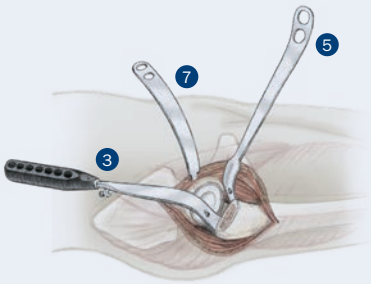
PRODUCT NO'S:	
6300-00 [Complete Set]	
Available Individually:	
6301-L [Awl – Left] *Overall Length: 12.375" (31,5 cm)*	1
6301-R [Awl – Right] *Overall Length: 12.375" (31,5 cm)*	2
6302-01 [Lighted Mueller Retractor] *Blade Width: 27 mm* *Handle Length: 5.5" (14 cm)* *Overall Length: 12.75" (32,4 cm)*	3
6303-01 [Wide Lighted Retractor] *Blade Width: 40 mm* *Blade Tip Length: 17 mm* *Overall Length: 12.75" (32,4 cm)*	4
6304-01 [Narrow Lighted Retractor] *Blade Width: 26 mm* *Blade Tip Length: 23 mm* *Overall Length: 16.5" (41,9 cm)*	5
6305 [90° Cobra Retractor] *Blade at Widest: 37 mm* *Blade Depth: 7.5" (19,1 cm)* *Blade Prong: 18 mm Long X 10 mm Wide* *Overall Length: 12.5" (31,8 cm)* *Handle Length: 9.5" (24,1 cm)*	6
6306 [Deep Hohmann Retractor] *Blade Width: 17 mm* *Prong Length: 34 mm* *Overall Length: 9.25" (23,5 cm)*	7
6307 [Straight Hohmann Retractor] *Prong Length: 4,2 cm* *Overall Length: 9.5" (24,1 cm)*	8
6308 [Femoral Starter Drill] *Drill Tip Dimensions: 18 mm Long X 12 mm Diameter* *Overall Length: 6" (15,2 cm)* *Shaft Length: 5.25" (13,3 cm)*	9

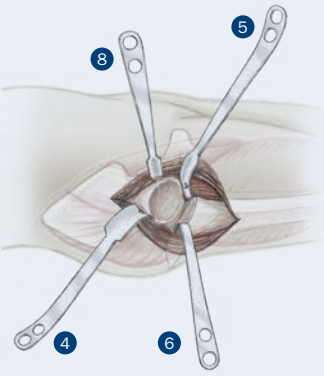
USA MADE

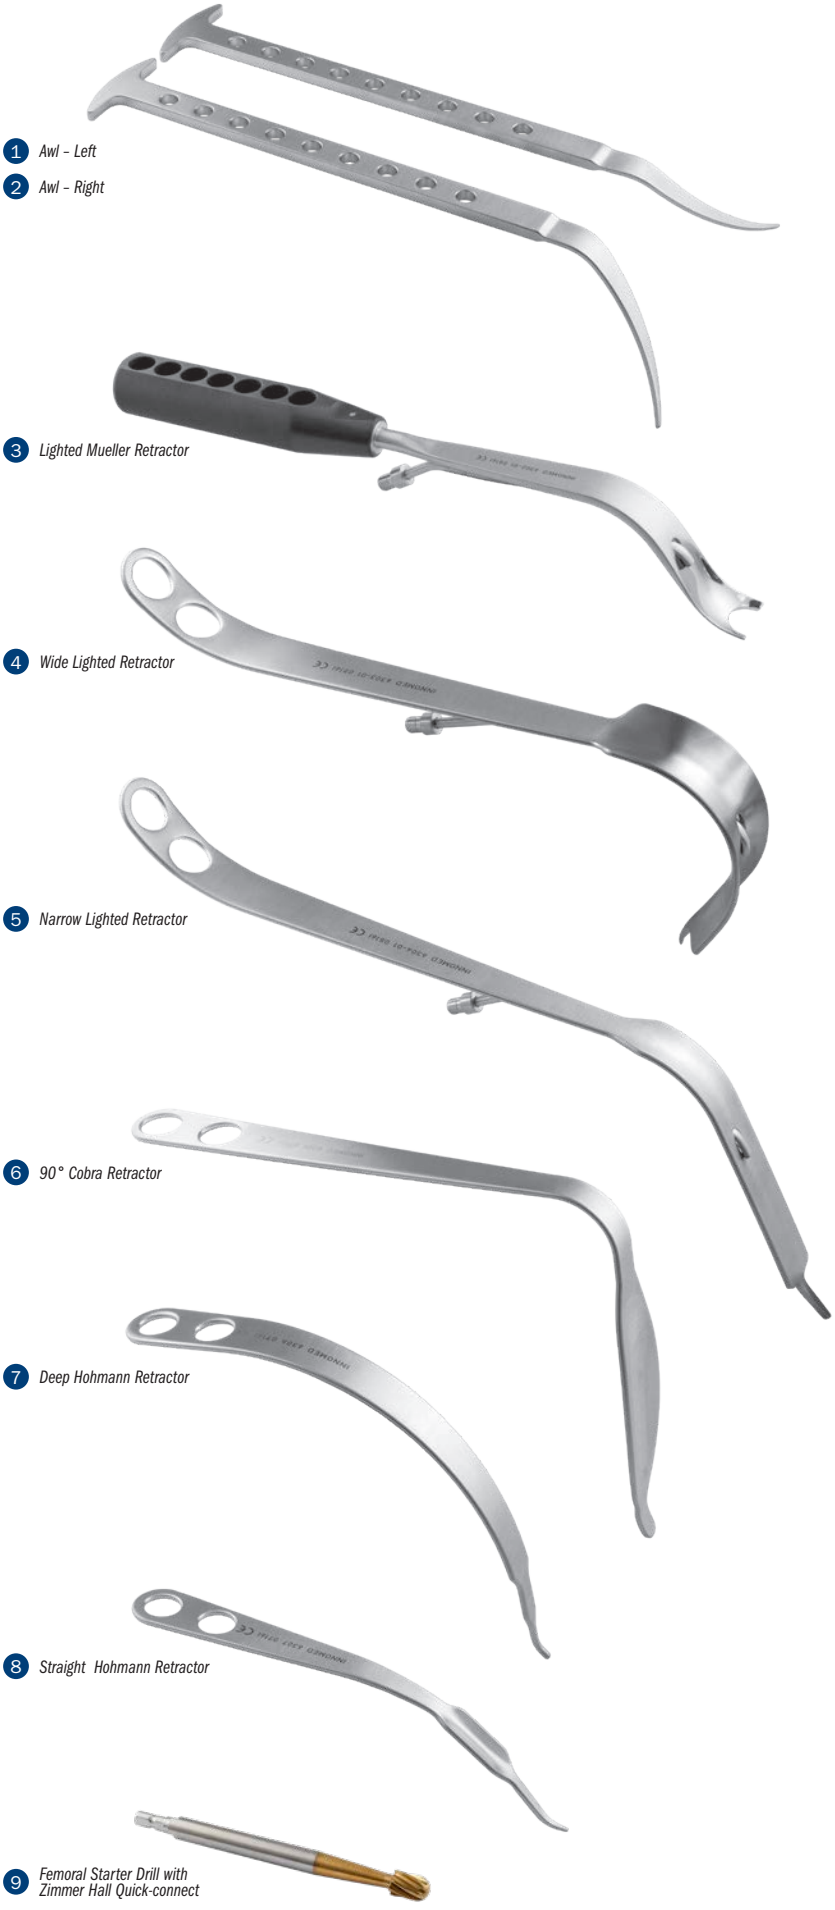
Lighted retractors can be attached to a fiber optic light cable with ACMI (female) connector and can be steam sterilized.

Optional quick-connect driver (**NOT INCLUDED IN RETRACTOR SET**) for use with the starter drill:

PRODUCT NO:
8248 [Fixed Driver with Zimmer Hall Quick-connect] *Overall Length: 5.75" (15,6 cm)* *Handle Width: 4.625" (11,6 cm)*







Jeffers Hip Retractor

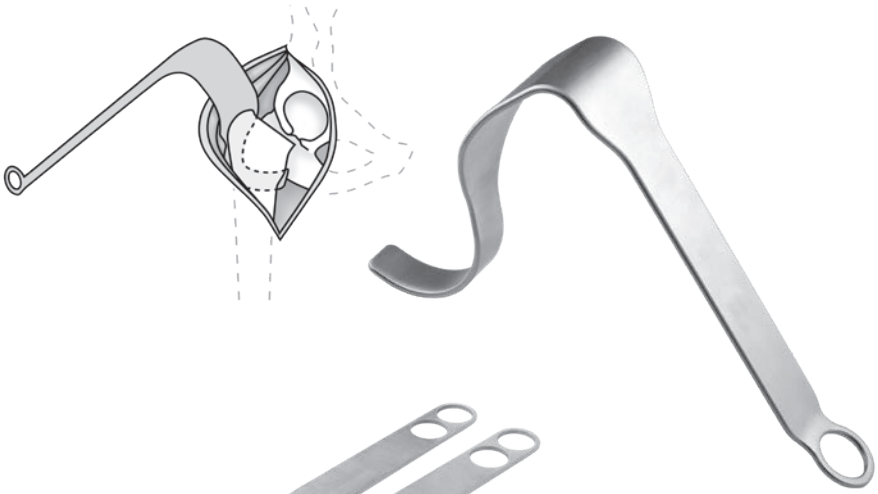
For use during the anterior approach, this retractor is designed to help protect the TFL from laceration during acetabular preparation in addition to maximizing exposure

Used with or without a weight, it is placed over the TFL and vastus lateralis and under the femur. The broad surface helps to gently retract the TFL and vastus away from the reamer path.

PRODUCT NO:
6384 *Overall Length: 9.5" (24,1 cm)* *Depth: 6.5" (16,5 cm)* *Blade Width at Top: 1.8" (4,6 cm)* *Blade Width at Bottom: .8" (2 cm)*

USA MADE

Designed by Andrew Jeffers, MD



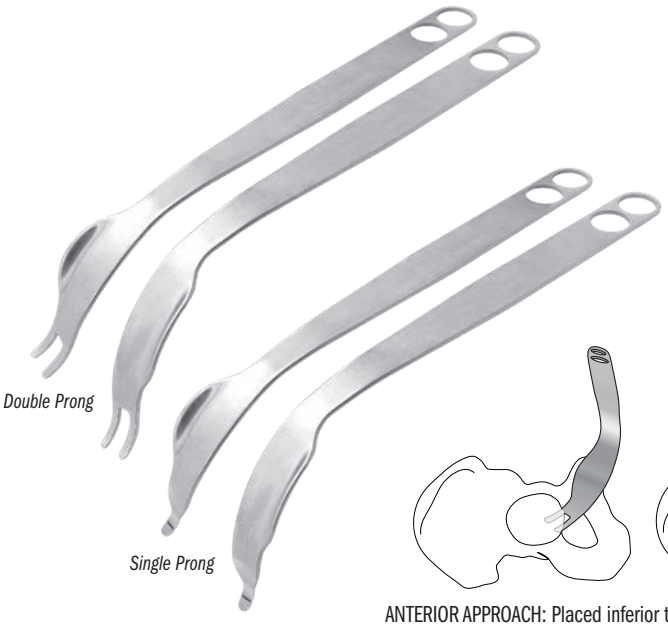
Flared Cobra Retractors – Left & Right

Left and right retractors can be used with the anterior, posterior or lateral approach to help expose the acetabulum in total hip surgery

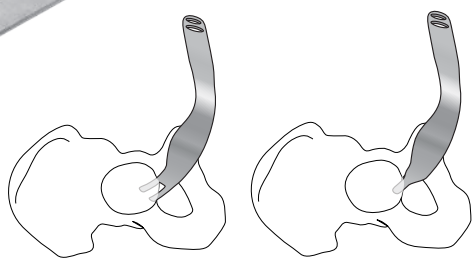
PRODUCT NO'S:
6110-01 [Double Prong – Right] *Overall Length: 15" (38 cm)*
6110-02 [Double Prong – Left] *Overall Length: 15" (38 cm)*
6109-L [Single Prong – Left] *Overall Length: 15" (38 cm)*
6109-R [Single Prong – Right] *Overall Length: 15" (38 cm)*

USA MADE

Designed by Henry Boucher, MD
Single prong design modification by Walter Frueh, MD



See page **19** *for posterior approach positioning*



ANTERIOR APPROACH: Placed inferior to the trans-acetabular ligament during exposure and preparation of the acetabular component. The curve and "twist" of the retractor allow for gentle retraction of the medial and inferior soft tissues and skin. Helps provide easier retraction for the assistant on the other side of the operating table.

Sinha Retractor for Acetabular Reaming

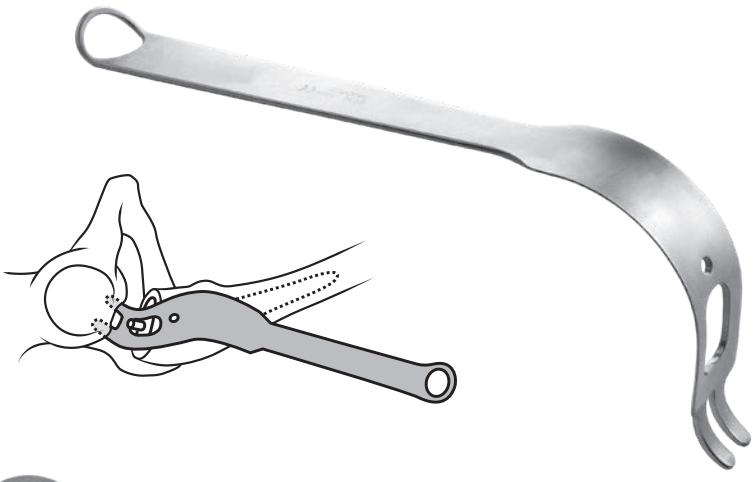
Designed to retract and protect the femur while preparing the acetabulum for reaming during antero-lateral approach total hip surgery

After the femur is prepared and the broach has been placed, the Sinha retractor is placed on the infero-lateral aspect of the acetabulum with the neck of the broach projecting through the large hole in the retractor blade. This serves to displace the femur posteriorly and to help protect the greater trochanter while acetabular reaming is conducted.

PRODUCT NO:
6174 *Overall Length: 12.5" (31,8 cm)* *Blade Width: 32 mm* *Hole: 18 mm W x 33 mm H*

USA MADE

Design modification by Ajoy K. Sinha, MD



Alvi Modified Hohmann Retractor

Designed for use during minimally invasive anterior hip replacement surgery, the retractor is placed through the capsule, into the femoral head, allowing for retraction of the rectus femoris

The extra bend in the handle allows the assistant to stand on the operative side of the table allowing for ease of handling of the retractor.

PRODUCT NO:
4549 *Overall Length: 8.75" (22,2 cm)* *Blade Width: .75" (19 mm)*

Bozeman Direct Anterior THA Femoral Elevator

Designed to elevate the femur anteriorly, providing exposure to allow broaching of the femoral canal and final placement of the femoral component, during direct anterior approach THA

Helps to retract the TFL muscle out of the way, and provides surface area for the fulcrum effect, helping to reduce pressure on the muscle. Narrow design is helpful in minimally invasive surgery.

The flared end joins the prongs to help maintain soft tissue retraction away from the broach teeth, while the two prong design helps placement lateral to the tip of the greater trochanter and elevates the femur.

PRODUCT NO'S:
6144 [Small] *Overall Length: 11.5" (29,2 cm)* *Blade Neck Width: 26.1 mm* *Blade Flared End Width: 30.1 mm*
6146 [Medium] *Overall Length: 13.5" (34,3 cm)* *Blade Neck Width: 29.8 mm* *Blade Flared End Width: 34.7 mm*

O'Reilly Dual Handle Direct Anterior Retractor

Designed for use over the anterior pelvic rim during acetabular exposure in direct anterior THA, the dual handle design allows for use in both right and left hips, as well as easy exchange of the instrument between assistants

Can be used in MIS/Direct Anterior, Total Hip Arthroplasty, Posterior/Anterolateral THA, and Hemiarthroplasty.

PRODUCT NO:
3011 *Overall Length: 13.25" (33,7 cm)* *Blade Depth: 4.25" (10,8 cm)* *Blade Width: 1" (2,5 cm)*

O'Reilly Direct Access Anterior Broaching Retractor

Designed for use in obtaining improved proximal exposure for femoral canal preparation during minimally invasive direct anterior THA

- Lateral flange protects the muscle of tensor fascia lata and soft tissues during insertion and removal of femoral broaching instruments
- Narrow tip for deep placement posterior to the femoral neck, anterior to the greater trochanter
- Rotation of the retractor handle helps keep the instrument against the patient and out of the surgeon's line of sight

Wixson Anterior Suspension Hook System

Designed for use with a standard operating room table, helps to facilitate elevation of the proximal femur during direct anterior approach THR

The system consists of:

1) A ***rotating clamp*** that can be attached to the operating table side rails over the drapes.
2) A ***vertical bar*** that fits into the clamp and comes above the side of the table.
3) A ***horizontal attachment*** that fits over the vertical bar and can swing over the wound.
4) A threaded ***tightening rod*** that inserts through a slot in the arm of the horizontal attachment and can be used to bring up the proximal femur.
5) A large ***offset femoral hook*** that can be placed above the lesser trochanter and around the posterior femoral neck and trochanter base. The handle of the hook has a chain to attach to the threaded tightening rod coming through the horizontal arm.

Used for femoral preparation after the acetabular component has been implanted

PRODUCT NO'S:
6245-00 [Complete Unit]
Replacement Parts:
6245-01 [Horizontal Attachment]
6245-02 [Tightening Rod]
6245-03 [Vertical Bar]
6245-04 [T-handle Bolt]
6245-05 [Offset Femoral Hook]
9125 [Rotating Table Clamp]

Compete unit includes: Tightening rod, horizontal attachment, vertical bar, T-handle bolt, offset femoral hook, and rotating table clamp

Alvi Small Charnley Style Locking Frame Set

A self-retaining frame and retractor system designed for use during anterior total hip arthroplasty, the blades help retract the hip capsule and musculature, permitting an unobstructed view of the acetabulum while freeing an assistant

PRODUCT NO'S:
7425-00 [Set]
Also available individually:
7425-01 [Small Locking Frame] *Dimensions: 9" x 7" (22,9 cm x 17,8 cm)*
7425-02 [2" Tapered Blade] *Blade Depth: 2" (5,1 cm)* *Handle Length: 7" (17,8 cm)* *Blade Width: 1" (2,54 cm)*
7425-03 [3" Tapered Blade] *Blade Depth: 3" (7,6 cm)* *Handle Length: 7" (17,8 cm)* *Blade Width: 1" (2,54 cm)*
7425-04 [4" Tapered Blade] *Blade Depth: 4" (10,2 cm)* *Handle Length: 7" (17,8 cm)* *Blade Width: 1" (2,54 cm)*

Set comes with locking frame (7425-01) and one each of the three blade sizes: 2" (7425-02), 3" (7425-03), and 4" (7425-04)

Powers Femoral Sounds

Allows the surgeon to gently identify the canal of a long bone as well as its width (isthmus) prior to inserting a device

Particularly useful for the anterior approach to the hip. Helps identify intraoperative occult fractures. Properly identifying the medullary canal before broaching helps minimize possible intraoperative fractures.

PRODUCT NO'S:

O'Reilly Femoral Head Extractor

Designed to help remove the femoral head– during THA, MIS Direct Anterior THA, and hip fracture surgery/hemiarthroplasty

The perpendicular osteotome blades help provide purchase in osteoporotic bone, while the central osteotome provides a visual estimate of the instrument's depth of penetration to avoid acetabular injury with use during hemiarthroplasty.

The handle helps obtain rotational torque needed to rotate and dislocate the femoral head in direct anterior hip arthroplasty.

PRODUCT NO'S:

Anterior Hip Referencing Rod Assembly

For use during intraoperative imaging while performing anterior hip arthroplasty to help determine implant fit, position, alignment and recreation of leg length and offset using the contralateral hip for reference

- Designed to be overlayed on the pelvis during the imaging part of the procedure to compare leg length and offset to the contra lateral hip using the trans teardrop or trans ischial line as reference
- Extended length allows the surgeons hands to remain outside of the imaging beam
- Notched in increments of 1 cm for ease of reference
- Features a threaded coupler midshaft to break down for processing and storage, allowing the unit to fit into a traditional tray

PRODUCT NO'S:
2674-00 [Complete Assembly] *Overall Length: 27.75" (70,5 cm)* *Rod Diameter: .25" (6,3 mm)*
2674-A [Top Assembly] *Overall Length: 16.75" (42,6 cm)* *Rod Diameter: .25" (6,3 mm)*

INNOMED

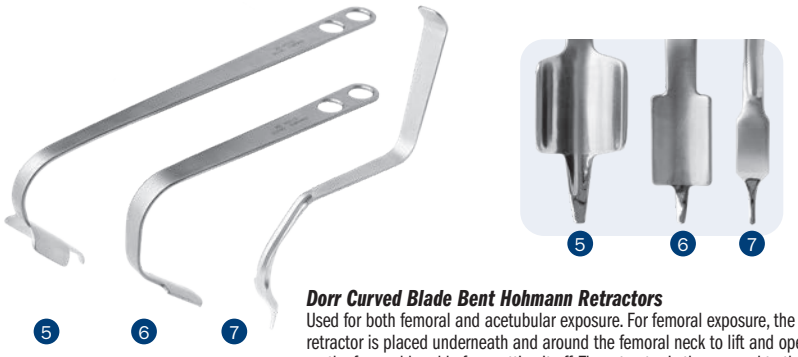
Dorr Curved Hohmann Acetabular Retractor
Placed over the top of the piriformis, helps retract the gluteus medius.

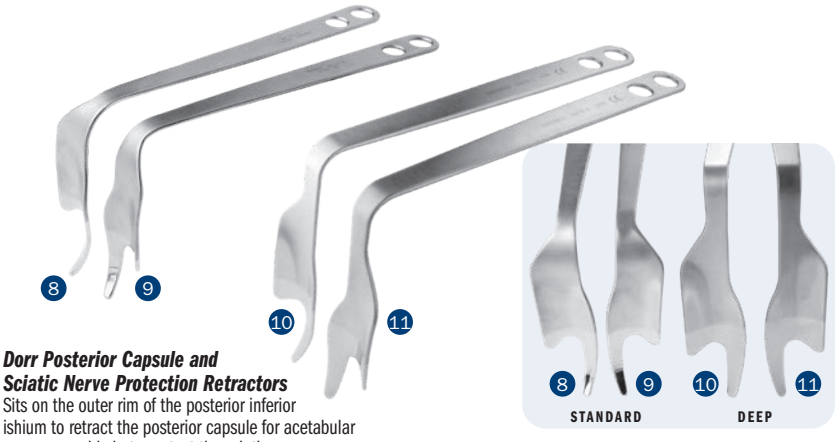
Dorr Narrow Bent Acetabular Retractors
Retracts the gluteus maximus off the trochanter and exposes the back of the greater trochanter. The long version is used with larger patients.

Dorr Bent Hohmann Acetabular Retractor
Placed between the capsule and outer external oblique muscle to protect medial circumflex vessels. The tip engages the condyloid notch bone (teardrop). Helps retract soft tissues during acetabular exposure.



Dorr Curved Blade Bent Hohmann Retractors
Used for both femoral and acetubular exposure. For femoral exposure, the retractor is placed underneath and around the femoral neck to lift and open up the femoral head before cutting it off. The retractor is then moved to the posterior superior corner of the acetabulum where the sharp tip can be tapped into the bone—this is also the position used during acetabular exposure.

Upward Double Bent Hohmann Retractor
Tapped into the illum to help retract the femur for acetabular exposure.



Dorr Posterior Capsule and Sciatic Nerve Protection Retractors
Sits on the outer rim of the posterior inferior ishium to retract the posterior capsule for acetabular exposure and help to protect the sciatic nerve.

Dorr Femoral Neck Elevators
Placed under the proximal femur to help expose the femoral head. The wide version is useful with large patients, while the narrow is useful when broaching or when the implant is in place.

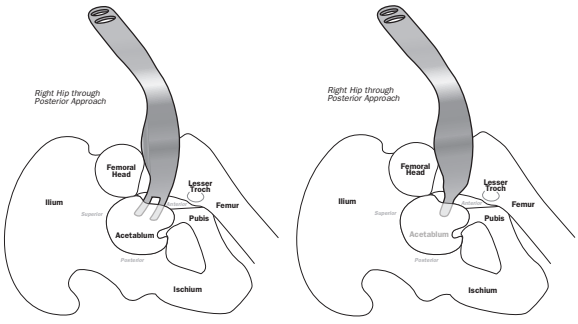
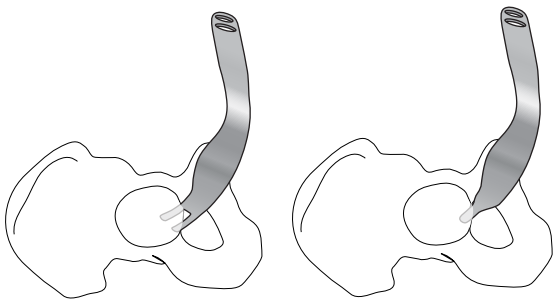
POSTERIOR APPROACH: Placed over the anterior acetabular wall for supero-anterior translation of the femoral head and neck during acetabular preparation. The prong(s) pierce the capsule over the anterior wall, then the curve and "twist" of the retractor allows for gentle retraction on the femoral neck.





ANTERIOR APPROACH: Placed inferior to the trans-acetabular ligament during exposure and preparation of the acetabular component. The curve and "twist" of the retractor allow for gentle retraction of the medial and inferior soft tissues and skin. Helps provide easier retraction for the assistant on the other side of the operating table.

Harwin Modified Cobra Retractor

Designed for use during total hip and knee surgery

The long handle and obtuse angle provide ergonomic leverage—especially helpful for use with obese patients.

In total hip surgery, the wide, concave blade design allows for enhanced exposure—especially useful in anterior hip surgery with the placement of reamers, and to elevate and expose the proximal femur.

In total knee surgery, the wide blade of the large retractor spans the prepared box and helps bring the tibia forward. The small retractor helps with retraction of the medial and lateral structures, where the wide, concave blade provides added exposure over standard bent Hohmann retractors. The serrated tip helps improve stability.

Posterior-Inferior Retractors

Designed for Total Hip Surgery

The posterior-inferior retractor is placed with the point at 6 o' clock and the retractor's axilla resting on the ischium. The remaining blade of this retractor is used to retract the remaining capsule from the posterior lip of the acetabulum.

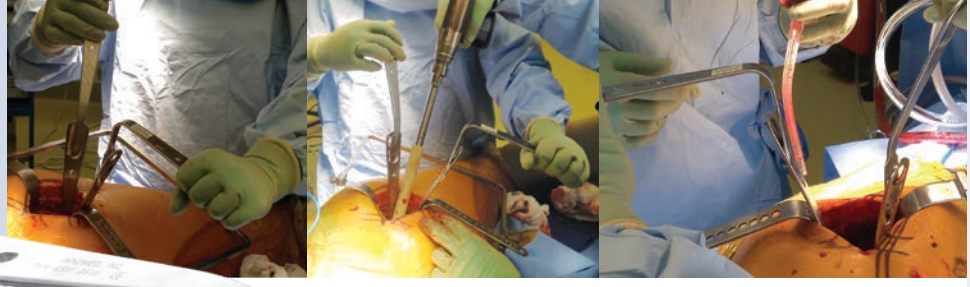
Goytia Stackable Hohmann Retractors

Interlocking design helps to increase depth and leverage in hip exposure, particularly of the anterior acetabulum—especially useful with large patients



- Custom fitted holes for interlocking retractors helps provide stabilty
- When "stacked", the increased lever arm of the retractor helps reduce fatigue
- Ideal for use with large patients where extra depth, leverage and force is needed

Lombardi Femoral/Gluteus Medius Minimus Retractor

Designed for acetabular exposure, and to retract the gluteus medius minimus during femoral reaming

Placed at the level of the ischium and driven into the ischium to retract the femur posteriorly when using an anterolateral approach. Also using an anterolateral or a modified Harding approach, the retractor can be placed in the tip of the greater trochanter and can effectively retract the abductor mechanism, namely the gluteus medius minimus so that reaming of the femur can be performed.

Tube and Extender Pins

Designed to help achieve wide exposure of the acetabulum during total hip arthroplasty

Tube pins with depth stops are inserted under direct visualization into the thick bone of the posterior column and illiac wing. Extender pins placed in the tube pins help keep the soft tissues from obstructing the view of the acetabulum. The low profile of the tube pins helps keep them out of the way of the surgeon. The extender pin can be removed or left in the tube pin depending on the size of the patient.

Lombardi Self-holding X-ray Magnification Marker

Helps to remove the variable of X-Ray magnification factor from the process of Orthopedic templating. The flexible, adjustable arm can help reduce patient (and technologist) embarrassment or discomfort when it is required to be positioned in a sensitive area such as the inner thigh.

Fully positionable, this orthopedic X-Ray calibration and marking device features a 1" (2,54 cm) stainless steel ball which, when properly positioned at bone level on a precise anatomical plane, will be this exact size when viewed from all angles, allowing it be used as a calibration marker in surgical planning software applications, helping to gauge the size of other components on that plane. This helps establish precise anatomical measurement.

PRODUCT NO:
2672 *Base Dimensions: 11" x 5.25" (27,9 cm x 13,3 cm)* *Post Height: 7" (17,8 cm)* *Arm Maximum Length: 13" (33 cm)*

Sanders Femoral Neck Cutting Blocks

Designed to help with accurate placement of the femoral neck osteotomy in total hip surgery

Used to measure the distance from the proximal end of the lesser trochanter to the level of the femoral neck osteotomy. The desired level of the femoral neck osteotomy is determined by preoperative planning. The exact level of the femoral osteotomy helps with leg length, either maintaining equal leg length or correcting leg length discrepancies.

Leg Length Caliper

Designed to help measure and evaluate pre- and post-THR leg length in conjunction with X-ray calibration and clinical judgement

The caliper utilizes a 5/32" (4 mm) pin in the iliac crest and a 1/8" (3,2 mm) pin in the greater trochanter. (The soft tissue is cleared away and a single drill hole is drilled in the trochanter to accomodate the distal pin, and the hole is marked with methyline blue so it can be easily found.)

Alternatively, a 7.3 mm cannulated screw that accepts a 3.2 mm pin may be used in the greater trochanter. Using the sliding caliper, the difference in leg length measurement before hip dislocation and after the THR procedure helps show the change in leg length.

A Sterilizable Level is included in the set, which helps to ensure the leg is in the same plane when initially putting the leg length caliper on and when reattaching the caliper.

Kenerly Femoral Neck Cutting Guide

Designed for use during the anterior approach for THA to help determine the femoral neck osteotomy location

The guide is placed on the femoral neck and adjusted using the intraoperative C-arm image to visualize and compare to the pre-op templating, providing an excellent location for the initial femoral neck osteotomy

Curved Femoral Head Impactor

Allows for in-line femoral head impaction during minimally invasive THR

The curved offset handle allows the head impactor to be slid under the skin of a small incision, and helps provide hand-held stability and maneuverability within the wound, while the impaction platform is easily accessible outside the wound. The impaction disc is made of delrin, which helps prevent marring and scratching of components.

O'Reilly Femoral Head Extractor

Designed to help remove the femoral head– during THA, MIS Direct Anterior THA, and hip fracture surgery/hemiarthroplasty

The perpendicular osteotome blades help provide purchase in osteoporotic bone, while the central osteotome provides a visual estimate of the instrument's depth of penetration to avoid acetabular injury with use during hemiarthroplasty.

The handle helps obtain rotational torque needed to rotate and dislocate the femoral head in direct anterior hip arthroplasty.

Verner Corkscrew Femoral Head Remover

Used to remove the femoral head during total hip arthroplasty or fracture surgery

Designed so the threads engage the head under power and draws the corkscrew in until the head begins to turn.

The extra long shaft keeps the power reamer out of the operative site for better visualization and improves the lever arm when pivoting the head out of the acetabulum. The grip ring allows the surgeon to pull head out of acetabulum and soft tissue envelope when disengaged from the driver.

Features a Zimmer Hall Quick-connect for use with a driver.

Femoral Head Removal Pin

Used to help remove a femoral head during total hip surgery

Partial threaded pin can be used to help remove a femoral head during total hip surgery. The pin is especially helpful in minimally invasive total hip surgery where access to the femoral head is limited. The pin is attached to a pin driver which clamps onto a Jacob chuck. When the pin is drilled in place, the driver is easily removed from the pin, as the pin is held by a friction ring. The head can be removed by gripping the pin by hand or by using a large pin inserter/extractor.

Teeth in jaw firmly holds bone and tissue

Non-locking design can be easily gripped while allowing greater pressure to be applied.

Used for dissection(to preserve)/or removal of the anterior capsule, removal of the labrum, or other soft tissue around the acetabulum prior to cup implantation. Also used to release the capsule to expose the femur for placement of the femoral stem. Long, low profile helps facilitate working through a small incision without disrupting vision.

3935 [Extra Large Slap Hammer] *3/8"-16 Thread Gauge*

Whelan Hip Stem Extractor

Designed to lock onto and remove a femoral hip stem after the modular head has been removed

Extraction normally requires two bolts to be used to clamp onto, tighten, and extract the component. Four bolt holes, distributed evenly around the stem extractor, allow the surgeon to choose which holes will offer optimal access for placing and tightening the bolts.

Anterior Approach Extractor

Extractor with the handle reversed designed primarily for anterior approach

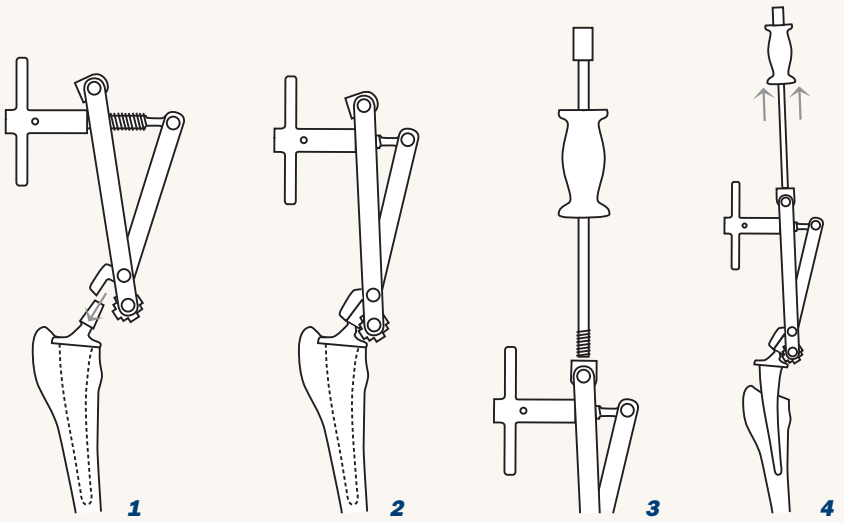
Universal Modular Femoral Hip Component Extractor

Helps remove a femoral hip stem after the modular head has been removed

USA MADE

Designed to clamp onto the taper of a femoral hip stem after the modular head has been removed. The extractor is equipped with a swivel block for attachment of a slap hammer. The swivel block helps keep the slap hammer in line with the angle of the femoral stem. Includes standard slap hammer, #3925.

PRODUCT NO'S:
3610 [Original Extractor with Standard Slap Hammer #3925]
3610-R [Anterior Approach Extractor with Standard Slap Hammer #3925]
Optional/Individual Parts:
3610-01 [Original Extractor Only]
3610-R-01 [Anterior Approach Extractor Only]
3925 [Standard Slap Hammer] *3/8"-16 Thread Gauge*
3935 [Extra Large Slap Hammer] *3/8"-16 Thread Gauge*



1 *Open Extractor Jaws*
The extractor is opened to accommodate any size taper on a modular head total hip stem.

2 *Use T-Handle To Clamp Onto Taper*
The taper is clamped between the rotating block and the taper anvil. Tightening the "T" handle holds a stem taper in place.

3 *Attach Slap Hammer*
The slap hammer is screwed into the swivel block. The slap hammer can be aligned with the stem utilizing the swivel block.

4 *Use Slap Hammer To Remove Component*
Extraction is carried out by the slap hammer or by utilizing a mallet on the hammer flares of the slap hammer.

Heck Anterior Modular Hip Component Extractor with Strikeplate

Strikeplate provides additional help to remove a femoral hip stem

In this process of placing the extractor over the neck and tightening the locking screw, the upper flange surface of the strikeplate can be hit to help engagement. The inferior flange surface of the strikeplate can be hit in a vertical fashion when the femoral component is particularly well engaged. The extractor is equipped with a swivel block for attachment of a slap hammer. The swivel block helps keep the slap hammer in line with the angle of the femoral stem. Includes standard slap hammer, #3925.

Lombardi Hip Cup Liner/Shell Extractor

Used for removal of a total hip cup or liner

Expandable flanges are designed to bite into the polyethylene of a total hip cup. When the flanges have been expanded, a slap hammer is screwed into the extractor for removal. The extractor can also be used for removal of a metal hip cup shell if the shell has a groove around the rim for the flanges to lock into. Also very helpful for cemented cup extraction. Set includes standard slap hammer #3925.

1 Stainless Steel Heads
In standard diameters of 22, 26, 28, 32 and 36 mm (38 mm optional).

2 Non-modular Blade System
Helps to decrease costs while increasing surgical efficiency as blades don't need to be changed interoperatively.

3 Fixed Blades in Two Lengths
Can typically be used for several procedures, then can be returned to Innomed for nominal replacement charge.

4 Shaft Alignment
The shaft is aligned directly over the head, which helps prevent the head from riding out of the cup while keeping the instrument properly centered. With proper centering, the curvature of the blades will more closely match the hemispherically-shaped outer surface of the acetabular cup when rotating, thus minimizing bone loss and creating a relatively intact acetabular recess for fitting of a new cup.

5 Handle Styles
Two handle styles to choose from– Wrench Drive or Fixed.

6 Impaction Platform
Strike with a mallet to help drive in the blade.

7 Handle Placement
Near the end of the shaft allows for better leverage and easier rotation.

ultra hard titanium nitride coating for extended blade life

Benefits of Our Titanium Nitride Coated Blades

- **Extends Blade Life**... *by increasing surface hardness*
- **Prolongs Sharpness**... *with an ultra hard, heat resistant coating*
- **More Wear Resistant**... *due to high lubricity of titanium nitride coating*
- **Prevents Galling**... *won't chip, peel, or flake*
- **Reduces Friction**... *eliminates seizing in metal-on-metal contact*
- **Chemical and Corrosion Resistant**
- **Non-toxic**... *medically approved and proven*

Extended blade life leads to long term savings

Instrument Exchange

Used Instruments can be returned for exchange at a nominal charge. Please call for details.

Universal Bone Grafting/ Impacting Forceps

Bone graft can be grasped, placed & impacted without changing hands or instruments

Designed with grasping ends for delivery of bone graft. When the graft is in place, the forceps are closed, which forms the ends into an impacting punch. A striking platform forms the end of the forceps for tapping and tamping the graft. Four end diameters are available in two lengths.

Used for removal of stripped hex screws, buried screws, partial screws with broken screw heads

Screw Extractors
Unique thread design accommodates removal of stripped screws. The instrument "locks" into the screw head and allows removal once engaged. Designed to be used in a counter-clockwise direction.

Trephines
Designed to fit over submerged screws for extraction with minimal bone loss. Extraction is enhanced by the unique tooth design. Designed to be used in a counter-clockwise direction.

Hex Drivers
Solid shaft in all standard hex sizes.

Hex Drivers
Four sizes with a cannulated shaft for easier removal of buried screws.

Universal Extractor
Designed to remove screws with heads partially or completely missing. The cone shaped head fully engages the remaining screw and optimizes the force needed for removal. The bolt is disposable and locks into place using a unique thread design. Designed to be used in a counter-clockwise direction.

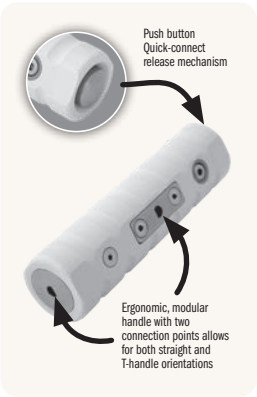
Screwdrivers
Standard cruciform screwdrivers in large, small, and mini, and single slot.

Cannulated Drive Extension
Used when a longer instrument shaft is desired.

Extractor Wrench

Pick
Used to remove fragments and bone or tissue from screw head.

Universal Instrument Handle
The single handle allows the surgeon to decide which direction is most efficient and comfortable. The quick-connect release mechanism allows for quick interoperative exchange.



Screw/Pin Removal Locking Pliers

Unique jaw designed to solidly grip and clamp onto a screw head, broken screw, or pin for removal

Trephine Sizes

For Screw Removal

The trephine ends are designed to fit over embedded screws for extraction with minimal bone loss. Six sizes available – internal diameters of 5 mm, 6.5 mm, 8 mm, 9 mm, 10 mm, and 11 mm. The T-handle allows for precise, controlled use.

For Core Bone Sampling

Cannulated T-handle and trephines allow use of a standard 1.6 mm (.062") threaded K-wire to help facilitate grasping and removal of a core bone sample for biopsy or core decompression. Variety of core diameters yields bone samples of sufficient size for pathology. K-wire not included.

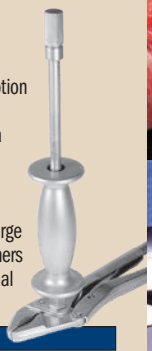
OrthoVise™

U.S. Patent #D398,208



Made of stainless steel and designed with the option of using a slap hammer for greater adaptability.

On models equipped with attachment bolts, a slap hammer can be attached to the end of the OrthoVise™, as well as to either side of the large OrthoVise™ (except the bent jaw model).

A different size slap hammer is used for the large and small sizes of OrthoVise™, and all slap hammers are designed with a hammer plate if the additional use of a mallet is desired.

REVISION

Flexible Osteotome System

Provides an assortment of osteotome blades for various orthopedic surgery procedures

- Sharp, flexible blades are well suited for loosening implants from cement or bony ingrowth fixation
- Various blade widths and profiles allow great flexibility to follow the implant contours
- Modular handle is made of high impact surgical stainless steel and has a quick-coupling positive locking mechanism for ease of use and quick blade changes
- Slap hammer threads into the handle and is designed to facilitate blade removal
- Optional Strike Plate can be attached to the Handle for direct striking with a mallet
- Optional Curved Chisel Blades are designed to help loosen the cement/prosthesis interval in TKA tibial tray and femoral component revisions. The curved design is useful in working around pegs & fins to get posterior cement access. Also helpful in revision of a total ankle prosthesis.

1 *Adjust Blades To Fit Component*
The straight or angled blades are adjusted by loosening the attached screws and sliding the blades into the desired position.

2 *Drive Blades Under Component*
The blades are driven under the tibial base.

3 *Tighten Threaded Rod Onto Component*
The site hole for the pointed, threaded rod can be aligned with the proximal surface of the tibial component by using the included hex wrench system. The pointed, threaded rod is tightened onto either a polyethylene or metal tibial component.

4 *Attach Slap Hammer Assembly & Remove Component*
The slap hammer assembly is threaded into the threaded rod handle for removal of the component.

Bozeman Cement Trimmer

Combines the two most common cement trimming tools into one

The blunt blade tip end helps with separation of the trimmed cement. The angled curette end helps gather the trimmings. The thin shank and angled curette can reach into tight spaces such as the back of the implants to remove excess cement. The titanium nitrite coated ends help eliminate metal transfer.

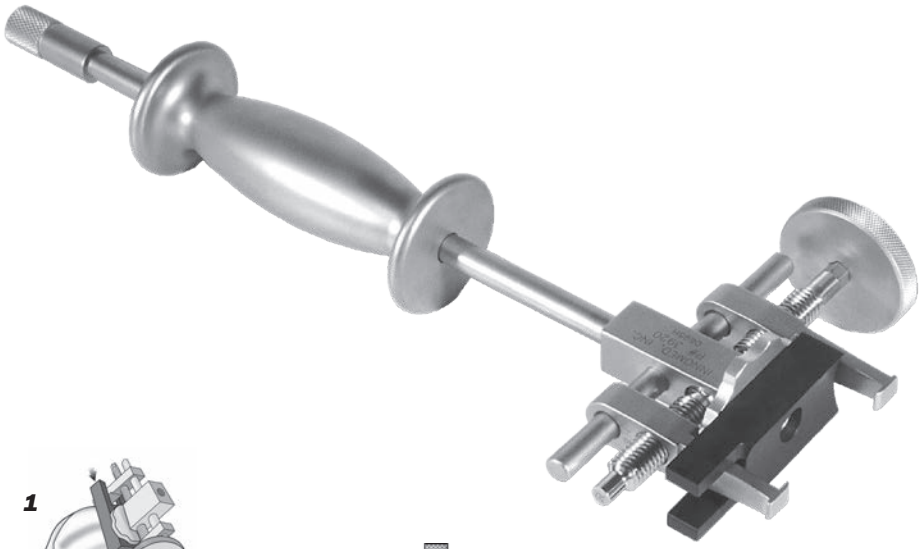
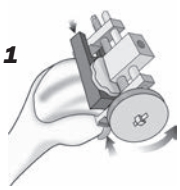
Femoral Component Extractor

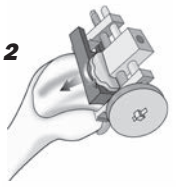
Universal extraction instrument clamps onto a femoral knee component for extraction

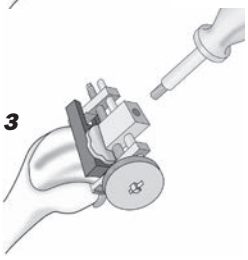
A standard set of jaws is used for slotted and unslotted femoral components. Features a round tightening wheel which allows the surgeon to easily tighten the jaws without using a separate socket wrench. The tightening wheel can be easily removed for replacing the jaws. The copolymer prosthesis stabilizing block allows access to the block tightening wheel. Includes standard slap hammer.

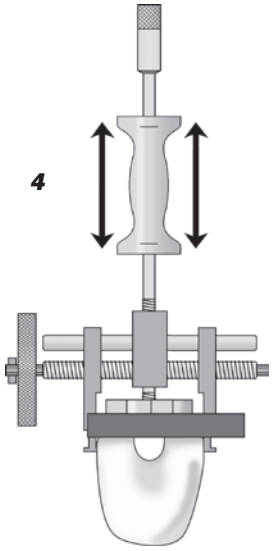
PRODUCT NO'S:
3920 [Extractor w/Std. Slap Hammer #3925]
Optional/Individual/Replacement Parts:
3920-SJ [Pair of Standard Jaws]
3925 [Standard Slap Hammer] *Thread Gauge: 3/8"-16*
3935 [Extra Large Slap Hammer] *Thread Gauge: 3/8"-16*











1 *Attach Jaws To Component*
The jaws are tightened against the femoral component with the socket wrench or tightening wheel.

2 *Stabilize The Component*
The delrin stabilizing insert is tightened against the femoral component by rotating the thumbwheel.

3 *Attach Slap Hammer Assembly*
The slap hammer assembly is threaded into the extractor body.

4 *Use Slap Hammer Assembly To Remove Component*
The slap hammer is also designed with a hammer flare for optional use with a mallet.

Cherf Leg Holder

Supports the lower extremity for prepping before knee or hip surgery

Useful for all lower extremity procedures and is particularly helpful for supporting the leg with the patient positioned in the lateral position. By holding the foot/ankle in an externally rotated position, the knee can be locked into extension which helps eliminate the need for manual support.

May also be used to support the limb for surgical patients in the supine position such as for knee and foot/ankle procedures.

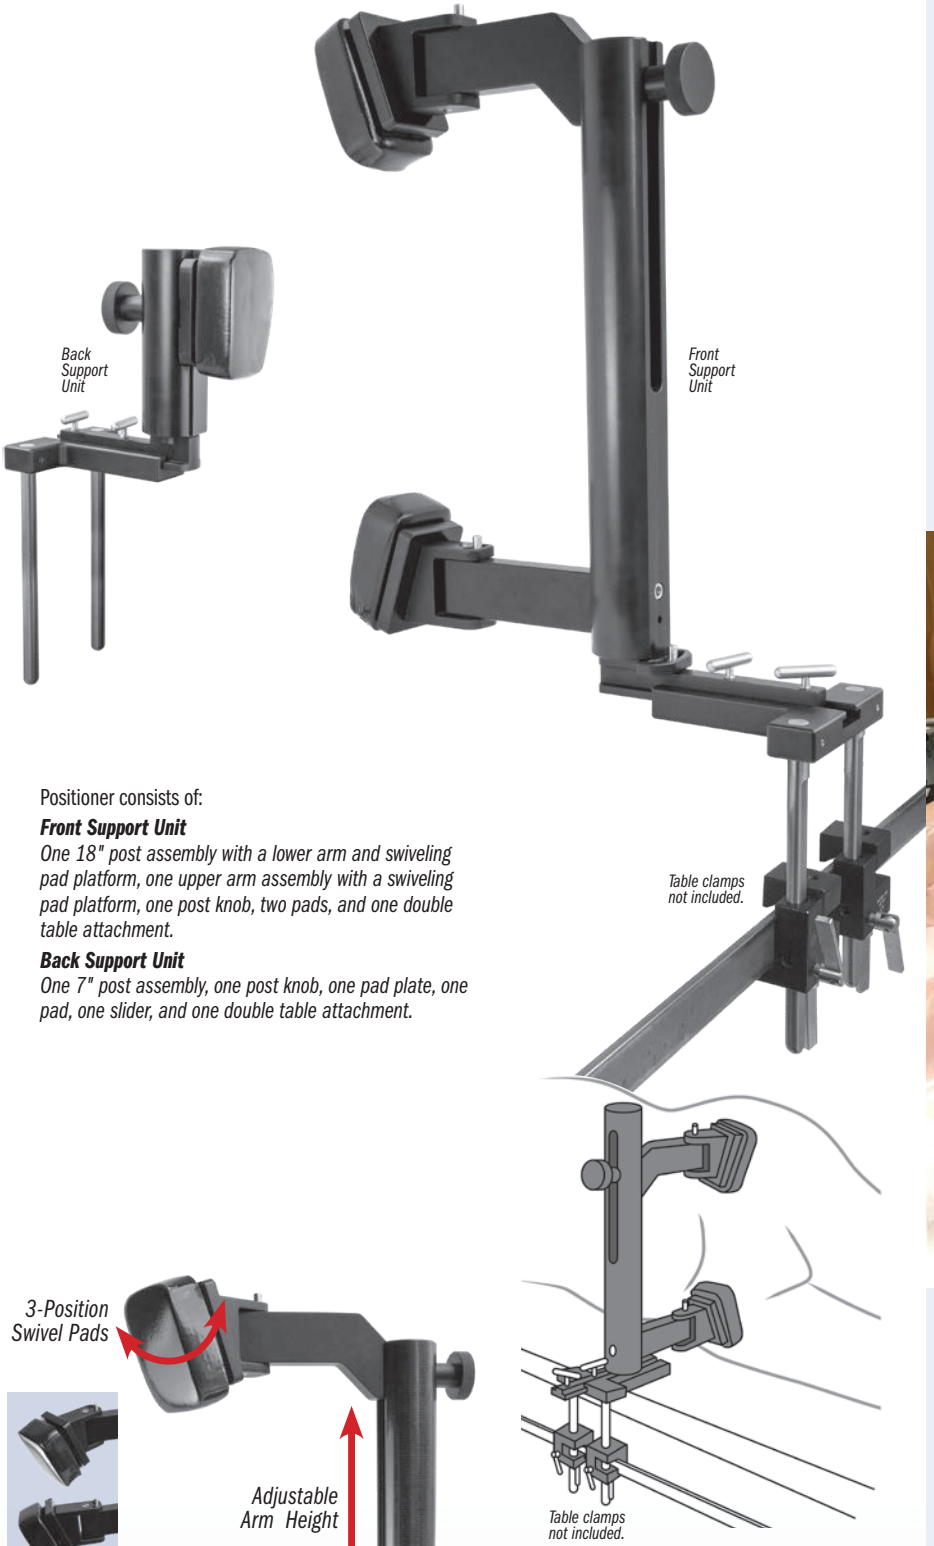
Thornberry Hip Positioner

Designed to be adjustable yet sturdy, and is especially helpful when stabilizing a large patient during total hip and revision surgery

The Thornberry Hip Positioner is designed to attach directly to the operating table utilizing existing table clamps, or the Innomed #2595 Table Clamps, which are not included.

The upper arm assembly can be adjusted for height. Both arms include a push-button to allow the pad platform to swivel and lock into any of three fixed positions. The tall 18" post also includes a push-button to allow the post/arms unit to swivel and lock into any of three fixed positions.

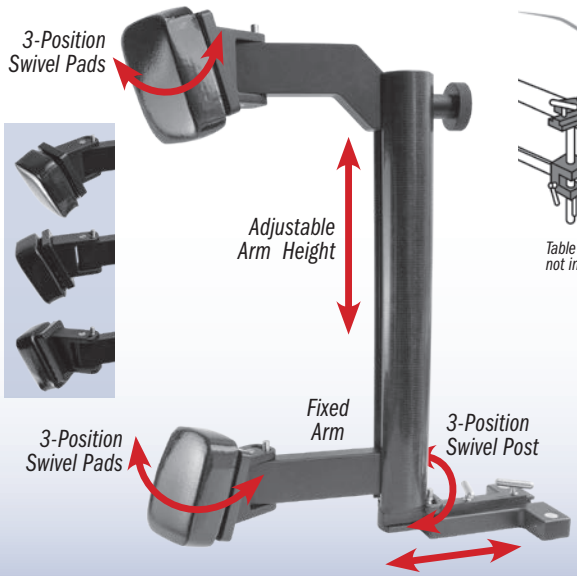
The complete unit is autoclavable except for the foam pads. The pads are made of semi-dense foam to help prevent pressure points and are sealed with a washable coating. The coating also helps to lessen the possibility of skin breakdown.



Positioner consists of:

Front Support Unit
One 18" post assembly with a lower arm and swiveling pad platform, one upper arm assembly with a swiveling pad platform, one post knob, two pads, and one double table attachment.

Back Support Unit
One 7" post assembly, one post knob, one pad plate, one pad, one slider, and one double table attachment.



Distance Between Arms (Centered):
8.5" (21,6 cm) Minimum,
17.25"(43,8 cm) Maximum

It may be necessary to place the Double Table Attachment(s) 180°—sticking out from the table—to accommodate the large patient, as shown at above.

Wixson Hip Positioner

Provides stable positioning of a patient during hip surgery

USA MADE

The Wixson Hip Positioner is used for stable positioning of a patient during total hip and revision surgery. It is designed to be placed on top of the operating table.

The base plate is rubber-backed to reduce slipping on the table. The uprights can easily be slid in and out of the multiple slots in the plate for desired positioning and locked into position with the locking bolt. The complete upright assembly is radiolucent.

The upright pads and the base plate pad are made of semi-dense foam to help prevent pressure points and are sealed with a washable coating. The coating also helps to lessen the possibility of skin breakdown.

The hip positioner consists of: One 10" post with double pads, one 6" post with a single pad, one 20" base plate, one base plate pad, two 2" spacers, one 4" knob, and one 6" knob.

The spacers and longer knobs are supplied for use with larger patients: use one spacer with the 4" knob, or combine the two spacers to use with the 6" knob.

The pad assembly can be adjusted for additional height and width. The upright posts are modular. The complete unit is radiolucent and autoclavable except for the foam pads.

Sanders Extremity Positioning Tubes

Designed to support the knee and ankle during lower extremity surgery

The 6" tube lifts the knee off the operating table and allows for approximately 30° of knee flexion. Very useful for closure of total knee incisions, supporting fractures of the distal femur, and tibia plateau fractures. The 4" tube elevates the foot and ankle for ankle fracture surgery. The tubes are made of aluminum, allowing them to be autoclaved. They help eliminate the need for rolled sheet bolsters.

Sanders Tube Holder

Designed to help stabilize the Sanders Extremity Positioning Tubes (#2740-01 & -02)

The tube holder will help stabilize the tubes when used for lower extremity positioning for lower extremity surgery. Also, by using the tubes with the Stulberg Sliding Bolster (#2730 – see page 82), the knee can be placed in less flexion during the initial incision and wound closure.

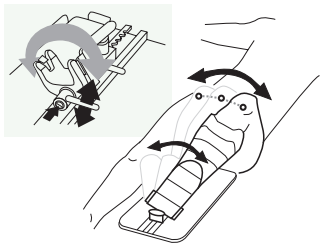
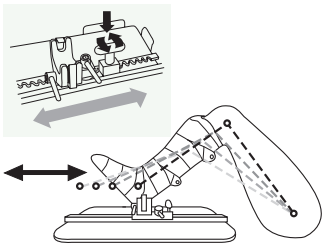
Tilt Bar



Loosening the Tilt Bar allows the knee to be tilted in either direction. Tightening the bar locks the Yoke System in the desired position.

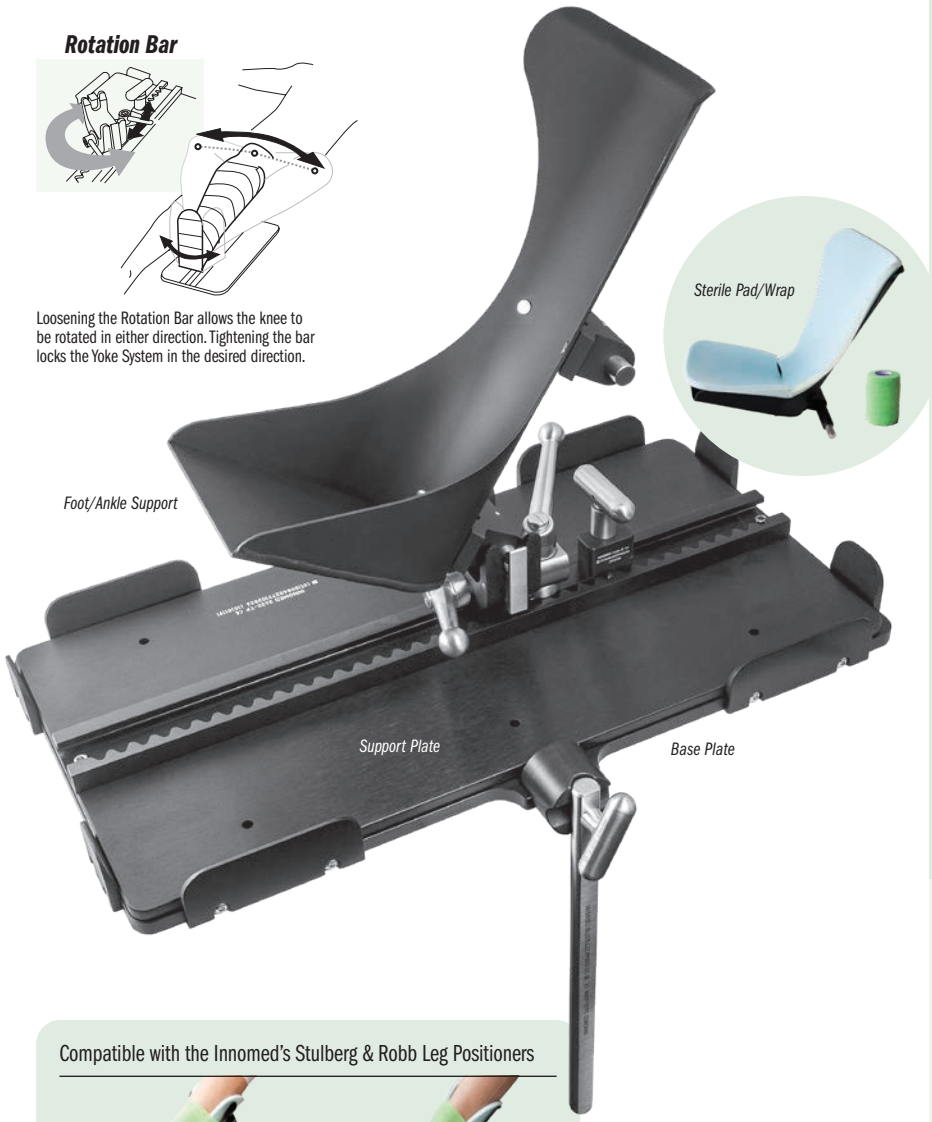
Ratchet



The Ratchet allows the Yoke Assembly to be moved in a precise gradual manner, the length of the Track. For faster adjustments, downward pressure on the Ratchet Handle releases the Yoke Assembly which then can be easily slid the length of the Track.

Rotation Bar

Loosening the Rotation Bar allows the knee to be rotated in either direction. Tightening the bar locks the Yoke System in the desired direction.



Compatible with the Innomed's Stulberg & Robb Leg Positioners

Stulberg Leg Positioner

Provides stable positioning of the knee during surgery

Allows the leg to be manipulated into the desired position and securely locked in place. It has the necessary adjustments to tilt, rotate, and flex or extend the knee. Extension/flexion adjustments can be made with quick release of the ratchet. In use, the base plate is clamped onto the operating table with the vertical side bar. The base plate is then draped and the sterile support plate lowered into the base plate. The patient's foot is wrapped into the foot support with a sterile bandage (additional padding may be used for thin tibias). The complete unit is steam and gas sterilizable. Three (3) Sterile Pads/Wraps are included with each new purchase.

Kirschenbaum Foot Positioner

Helps eliminate the use of sand bags under the drape during total knee surgery

The foot rest is dome shaped for optimal foot contact and positioning the leg in flexion, and can be rotated. The unit can be used under the drape by attaching it to a standard table attachment or it can be sterilized for use on top of the drape. It can be attached to the table with the optional sterilizable table clamp. Supplied with a removable, sterilizable silicone foot pad.

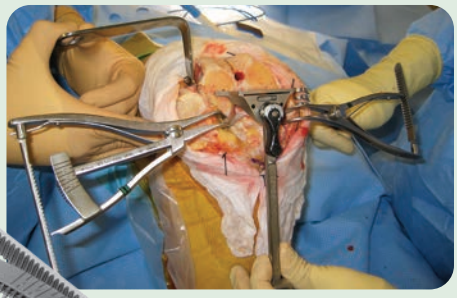
Scott Femoral Tibial Tensor/Spreader

Used before determining femoral component rotation to help properly tense the medial and lateral ligaments and help assure a stable, balanced flexion gap



An important part of surgical technique during total knee arthroplasty is the establishment of a symmetric balanced flexion gap. This can be achieved by tensing the medial and lateral ligaments with laminar spreaders and rotating the femoral component until a rectangular space is formed. The calibrated Tensor/Spreader allows the surgeon to choose a reproducible amount of tension across the medial or lateral flexion space.

In the varus knee, any medial release necessary to balance the knee in extension is performed first. In the valgus knee, the flexion gap can be balanced before the extension gap if the lateral retinaculum (not the lateral collateral ligament) is all that needs releasing to correct the deformity.

The spreader can be used before or after tibial preparation and also during revision surgery after a well-aligned tibial platform has been established.

Trans-sulcus Angle Guide

Helps establish the trans-sulcus line

A line is drawn down the deepest part of the trochlear sulcus (Whiteside line) with a marking pen or cautery. The post on the guide is inserted into the hole in the femur made for an intra-medullary alignment guide. The trans-sulcus angle guide is then rotated until the line on the guide lines up with the Whiteside line. A line is then drawn along the bottom of the guide.

Meftah PCL Protector

Designed to help protect the posterior cruciate ligament in cruciate retaining total knee surgery during the proximal tibial cut

The PCL Protector can be used efficiently right before the tibial cut. It is curved distally so that it can put over the PCL from the top/posterior side and with a few taps, the fanned blade can get around the PCL and into the bone (not more than 5 mm) and "cover" the PCL. The protector is left in place until the tibial cut is made with a saw, which would hit the protector instead of the PCL if it gets too close.

Bargo Femoral Lift

Designed to distract the distal femur up and away from the proximal tibia during TKR to help expose the popliteal fossa and access the soft tissues for meniscal excision

Particularly useful when using a 3D printed cutting block, where drilled access to the intramedullary canal (to help lift the femur) is unavailable.

PRODUCT NO:
3649 *Overall Length: 6.75" (17,1 cm)* *Handle Offset: 3.5" (8,9 cm)* *Handle Length: 5" (12,7 cm)* *Lift Pad: 2" x 1.675" (51 mm x 41 mm)*

Designed by Lonnie Bargo, CSFA

Collateral Ligament Retractor

Helps protect the lateral collateral ligament while exposing the proximal tibia

Used during total knee surgery and is inserted between the lateral collateral ligament and bone to protect the ligament and expose the proximal tibia. The dual prongs keep the retractor from rocking and assist in the insertion. The retractor is bent so that it is out of the way of the operating surgeon.

AORI Patellar Retractor

Designed to enhance total knee exposure

Has a deep basket and two rows of teeth to grab and hold to the lateral side of the patella. The curved handle provides a fulcrum so that the applied force will both displace and evert the patella from the femur. Retractor is placed after a routine midline, midvastus, or medial para patellar surgical approach to the knee. Once the patella is everted the retractor is applied to the lateral border of the patella.

Bicos Meniscal Repair Retractor

A popliteal retractor specifically designed for meniscal repair or access to the posterior knee

Used when an inside out meniscal repair is indicated, the design facilitates retracting the posterior soft tissues of the popliteal fossa out of the way, allowing passage of meniscal repair needles.

The retractor's compact design facilitates a minimally invasive incision. The unique shape helps capture the meniscal repair needles and direct them out of the posterior incision for easy grasping and repair. Incorporates a shiny body to help reflect inside the posterior wound and aid in seeing and retrieving the needles.

PRODUCT NO:
2731 *Overall Length: 5" (12,7 cm)* *Depth: 1.625" (4,1 cm)* *Diameter: 28 mm*

McMaster Medullary Canal Aspirator

Designed to aspirate the medullary canal prior to insertion of the solid instrumentation alignment rod to decrease the amount of semi-liquid material present

Helps evacuate excess fat and marrow content from the medullary canal of a long bone, helping to reduce the pressure and force created during insertion of a metal rod into the canal, which can possibly cause such materials to be emobilized into the circuclation system (and eventually into the lungs) through open venous structures.

The guide wire serves a dual purpose: To help break up the medullary bone in the proximal metaphysis to facilitate the passage of the fenestrated rod, and after the procedure to assist in cleaning and clearing the cannulated portion of the rod.

Also can be used on the tibial side if an intramedullary guide system is used. Can also be used during femoral rodding procedures for fractures.

Pin Inserter

Used for 1/8" (3,2 mm) diameter pin insertion

Designed to hold onto a pin while it is being inserted into a cutting block during total knee surgery or other applications. Holds the pin tightly, yet releases it easily after insertion. May be used with round or triangular end pins.

PRODUCT NO:
4020 *Overall Length: 5" (12,7 cm)*

USA MADE

Pin Inserter/Extractor

Helps provide better leverage, stability and control when inserting/extracting pins

Completely cannulated allowing use on long pins where the instrument can be next to the bone or skin for stability and control. The grasping end is contoured to not block the surgeon's field of view. The handle is shaped so not to slide in the surgeon's hand and for better leverage. May also be used to pull a drain needle from the surgical site. The design helps to protect operating personnel from the sharp tip of the needle. A slap hammer may be screwed into a threaded pin inserter/extractor to help in removing pins in hard bone.

Colwell TKA 5° Tibial Rasp Assembly

A tibial planing tool with a universal design to help improve tibial cut alignment and flatness by smoothing out imperfections intraoperatively, helping to ensure the tibial bone surface is cut correctly in coronal and sagittal planes

After the planer rasp handle/plate unit is threaded onto the intramedullary rod, the handle is moved back and forth through an arc while the cutting surface of the planer is held against the tibial bone, to realign the cut and to remove any imperfections.

For use with any primary or revision knee system when an intramedullary cutting guide is being used.

Kodkani Tissue Elevator Suture/Graft Passer

Designed for MPFL reconstruction basket weave technique, and helpful for mini-open ligament reconstruction surgeries for graft passage

Can also be used for:

- Periosteum/soft tissue elevator or freer
- Percutaneous passage of tendon/ligament graft/suture
- Stripping tendon grafts off muscle
- General orthopedics – repiosteum elevator and spike

Advantage of the open slot:

- Convenient feeding and removal of sutures from slot
- Feeding of multiple thick sutures & sutures with knots
- Engaging and shuttling grafts with short suture loop ends

Rosenstein Tibial Fragment Grasper for UKA

Designed to help remove the tibial bone fragment in one piece during Unicompartmental Knee Arthroplasty

The narrow grasper with its thin lower jaw is inserted under the femoral condyle, helping to secure the tibial fragment throughout it's entire length, and to remove the fragment without breaking it. The angled design helps keep the surgeon's hands out of the way and facilitates visualization.

Gelbke Freer Cement Trimmer/Nerve Hook with TiN Coating

Designed to facilitate cement removal during total and partial knee replacement

- A freer elevator on one end and a nerve hook on the other
- Nerve hook accesses "tough to reach" corners of the knee
- Particularly useful for use with an ultra-congruent polyethylene insert, where trial liners are typically not used, once the final components have been placed
- Ultra hard titanium nitride coating helps to extend life by increasing surface hardness, prolonging sharpness, and resisting chemicals and corrosion

PRODUCT NO:

Bozeman Cement Trimmer

Combines the two most common cement trimming tools into one

The tool has a blunt blade tip on one end to help with separation of the trimmed cement. The angled curette end helps gather the trimmed cement. The thin shank and angled curette can reach into tight spaces such as the back of the implants to remove excess cement. The ends are titanium nitrite coated to help eliminate metal transfer.

Wilson Condylar Gauge

Designed to measure the posterior femoral condyle after the posterior cuts have been made in total knee arthroplasty

By measuring the depth of the residual condyle, the surgeon can resect excessive bone and measure the bone remaining to avoid impingement of the condyle against the tibial component which could impair knee flexion. The gauge is applied to the inferior or posterior cut surface of the femoral condyle, and the back to front residual bone is measured and then removed as needed. Measures to 30 mm.

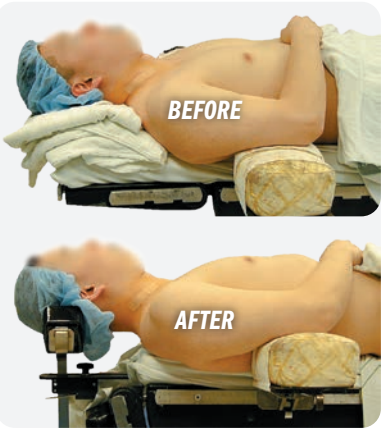
A gel pad forehead strap with velcro is included for optional use.



The osteotomized coracoid is fixed with the lateral, joint-facing side of the coracoid (where the ligament is) facing the flange of the drill-guide.

Two 3.5 mm guiding holes are drilled.

The drill guide is held against the antero-inferior glenoid, the flange sitting on the cartilage, and the first 2.5 mm thread hole for screw fixation is drilled.

The second 2.5 mm thread hole is drilled parallel to a 2.5 mm pin that has been inserted in the first hole to ensure correct distance and orientation.

The coracoid is now fixated using two 3.5 mm or 4.5 mm screws flush with the cartilage, due to the identical distance between flange and screw holes on coracoid and glenoid.

Durham Offset Kolbel Shoulder Retractor Set

Designed for retraction of the deltoid and under the short head of the biceps muscle to expose the shoulder, the longer offset blades are useful in patients with large muscles, and the shorter offset blades are useful in smaller elderly patients

Snap-in, freely pivoting smooth curved blades help to concentrate the forces on the center of the muscle bellies, allowing the retractor to remain centered and not get in the way of exposure.

Modified Darrach-type Elevators

Used for soft tissue retraction and exposure. May also be used to lever the humeral head inferiorly or superiorly and medially to expose the humeral head from the glenoid while dislocating the humeral head after subcapularis removal. May also be used to retract the humeral shaft posteriorly to help expose the glenoid.

PRODUCT NO'S:	
1950 [3/8" (10 mm)] *Blade Width: 10 mm* *Overall Length: 10.75" (27,3 cm)*	1960 [3/4" (19 mm)] *Blade Width: 19 mm* *Overall Length: 10.75" (27,3 cm)*

Kaminsky OrthoLucent™ Browne-type Deltoid Retractors

Used for the Delto-Pectoral Approach—can remain in place for fracture reduction, plate positioning, and screw/wire/drill location confirmation

Used for acromioplasty, rotator cuff repair, and fracture fixation. Contours the humeral head with deltoid retraction allowing extensive exposure. Helps to reduce operative time, assist in fracture reduction, and maintain hardware position without the frequent need for retractor removal and reintroduction.

The OrthoLucent™ carbon fiber PEI composite material is strong, lightweight, completely radiolucent, helps to prevent from marring component surfaces, and can be steam sterilized.

Levy Wide Deltoid Retractor

Designed for management of proximal humerus fractures—facilitates appropriate deltoid retraction without interference during active fluoroscopy

Contoured to match the curve of the deltoid, the retractor helps to retract the entire deltoid laterally during the deltopectoral approach. The width approximates 2/3 the length of the deltoid, while the blade is deep enough to help control the entire deltoid without displacement of the tuberosity reduction. Sized to fit deltoids in small and large patients.

Nicholson Small Bone and Shoulder Cement Removal Gouges

Designed to facilitate cement removal in smaller diameter bone of the humerus, ulna, and smaller implant geometries

- Reverse bevel tip helps the gouge to slide between the bone and cement.
- T-shaped Gouge-Splitter allows the gouge to slide between the cement and bone and vertically split the cement mantle to facilitate removal.
- Small diameter widths and curvatures more closely match shoulder and elbow implants and smaller bone diameters.
- Shorter length allows for better control and access.

Argintar Bicep Tenodesis Sleeve

Designed to help facilitate mini-open sub-pectoral bicep tenodesis—by maintaining the trajectory of the drill with the serrated end of the sleeve, the drilled humeral holes are easily found with standard percutaneous placement of the bicortical button

Once flipped, the slotted cut out in the sleeve makes detachment of the button applicator possible, helping with efficient and reproducible mini-open bicep tenodesis using button technique.

Lateral Condyle Fracture Set

Designed for adult and pediatric lateral condyle fractures

The asymmetric clamps (1756-L & 1756-R) are shaped to secure the lateral condyle fragment. The straight tip is placed in the coronoid fossa and the curved tip is used to grasp and compress the lateral condyle fragment. The symmetric reduction clamp (1755) is useful to compress T-condylar fractures, and in many other fracture reduction applications.

PRODUCT NO'S:
4697-00 [Set with Case]
Set Includes:
1755 [Clamp – Symmetric] *Overall Length: 8.5" (21,6 cm)* *Jaw opens to: 3" (7,6 cm)*
1756-L [Clamp – Asymmetric Left] *Overall Length: 8.75" (22,2 cm)*
1756-R [Clamp – Asymmetric Right] *Overall Length: 8.75" (22,2 cm)*

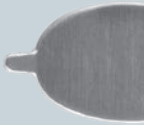
Weinert Elbow Retractor

Designed for use within the elbow joint to retract the anterior capsule, and provide full exposure of the anterior articular surface for reduction and fixation of displaced lateral condyle fractures

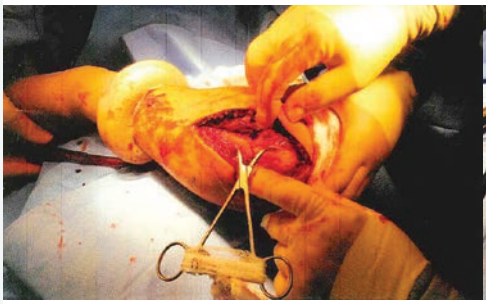
The small blunt tip hooks over the intact medial condyle.



Weinert Bone Holding Reduction Clamps

Designed to securely hold fracture reductions

The stops on each end help prevent excessive penetration of metaphyseal and soft bone.



Calvo Olecranon Reducing Forceps

Designed to reduce and hold in place transverse fractures of the olecranon to facilitate the insertion of k-wires and tension bands

Also very useful in malleolus fractures.

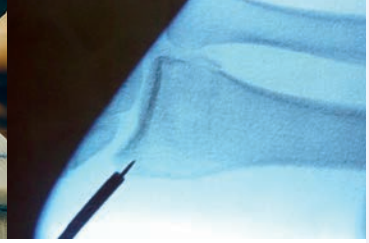
Sanders Pin Inserters

Designed to aim and control the placement of flexible k-wires when they contact hard cortical bone, while helping to protect neurovascular structures from the spinning wire



Inserter ends are smooth and can be passed through skin and tissue with less danger to neurovascular structures. Can be inserted through appropriately placed small peripheral incisions and placed on the bone with direct vision from the primary incision. The K wire is then passed through the inserter, helping to protect adjacent soft tissue structures.

Ideal for wrist surgery such as distal radius fractures, intercarpal fusions, carpal dislocations, etc., where K-wires must be inserted from angles not accessible through the initial incision. Also useful for arthroscopic fixation of the scaphoid.

PRODUCT NO'S:
3015-081 *Accepts k-wires up to: .081" (2 mm)* *Tube Length: 1.875" (4,8 cm)* *Overall Length: 4.25" (10,8 cm)* *Handle Length: 3.15" (8 cm)*
3015-054 *Accepts k-wires up to: .054" (1,4 mm)* *Tube Length: 1.875" (4,8 cm)* *Overall Length: 4.25" (10,8 cm)* *Handle Length: 3.15" (8 cm)*

Redler Wrist Bone Clamp with Wire Guide

Designed to hold bony fragments in place for placement of guide wires

Can be used for:

- Placement of pins across distal radius fractures or across carpal bones
- Arthroscopically assisted fixation in the wrist
- Fracture fragments about the elbow
- Placement of guide wires during the open reduction and internal fixation of a patella fracture

PRODUCT NO'S:
1885-45 *For Pins up to .045" (1,1 mm)* *Overall Length: 9.5" (24,1 cm)* *Jaw opens to: 3.5" (8,9 cm)*
1885-62 *For Pins up to .062" (1,6 mm)* *Overall Length: 9.5" (24,1 cm)* *Jaw opens to: 3.5" (8,9 cm)*

Two sizes available:
For use with .045" (1.1 mm) or .062" (1.6 mm) K-wires.

Redler Percutaneous Pin Clamp

Holds a small bone in apposition during percutaneous pinning of a fracture

Designed with a proximal pin tube with teeth; the tube guides the pin and the teeth help keep the tube in place on the bone. The distal tip is used to control the bone fragment. Includes a long ratchet for locking on various sized bones, from 1 mm to 14 mm. Also useful during insertion of cannulated screw guide wires.

PRODUCT NO'S:	
	Overall Length: 5" (12,7 cm)

Pointed Fracture Reduction Clamps

Versatile set of fracture reduction clamps, each with a specific tine design that allows for appropriate vector placement so that anatomic reduction can be obtained in a number of different types of fractures

- 1.9 mm tines allow for a snug fit in 2 mm drill holes
- Tines angled to prevent clamp "slippage" with compression
- Straight tines can be placed deep within bone which allows for far cortex compression
- Clamps incorporate a box joint design that prevents clamp joint loosening and the need for tightening
- Example applications: any transverse fracture (straight-straight clamp), both bone forearm fractures, olecranon fractures, medial malleolus fractures, and many more
- Speed Lock Style: Extra-long spin down allows for increased range of clamp use, and open-topped joint rotates to allow for increased range of opening, and also allows for quick release

Hagan Carpal Tunnel Release Sleeve

Designed to protect the surrounding anatomy while providing a sleeve within which to smoothly advance a beaver-style blade to divide and release the transverse carpal ligament

Designed for use in a mini-open, non-endoscopic approach, the sleeve isolates the blade, providing protection to the surrounding anatomy. The longer, bottom leading edge of the sleeve is inserted between the median nerve and the transverse carpal ligament, while the shorter, top leading edge provides lifting protection to the structures above the ligament. The blade is then advanced within the sleeve to complete the ligament release.

Designed to use a Beaver-style Mini-Meniscus (Flat) 4 mm Blade. Blade not included.

Macko Square Tipped Rongeur

Unique square tipped rongeur designed for Total Ankle Arthroplasty

Aggressive, low profile jaws aid in the removal of tibial bone in spite of limited space. The square ended tip helps produce a flat, finished surface following anterior talar facet reaming. Features such as the ergonomic grip, double action mechanism, long reach, and low profile make this rongeur also useful in spine, hip, and knee surgery. When used for morcelizing bone graft, the shallow, wide jaw helps avoid impaction.

Gurbani Joint Distractor/Compressor

Versatile joint distractor/compressor provides 360° freedom for arthroscopic or open procedures of foot, ankle, hand, and wrist joints

The surgeon puts the pins in the bone, then slides the holes of the device over the pins and distracts or compresses—the device can be locked in either direction. Especially useful for arthroscopy of subtalar, talo-navicular, calcaneo-cuboid, and wrist joints. The T-wrench helps provide precise, controlled manipulation.

Pin Hole Sizes: .15" (3,5 mm) and .182" (4,5 mm)

Ortho Self-Retaining Retractor with Pin Guides

Designed for small joint use with pin guides that are set back to allow either direct distraction or distraction with pins

- Parallel pin guides allow pins up to 2 mm
- Serrated outside blades extend .4" (1 cm) beyond end of guides

Uses include:

- Osteotomy distraction (such as the Evans or Cotton in the foot)
- Joint distraction for arthodesis or lengthening applications
- Fracture distraction

Wurapa Small Joint Compressor and Distractor

Designed to allow one-handed manipulation and deployment once fixation pins are placed

Pins should be cut short above the pin guides to allow full access to the operative site.

Designed to simplify several small joint procedures:

- Preparation of small bone non-unions before bone grafting and fixation
- Preparation of small joints for arthrodesis (e.g. partial wrist fusion)
- Distract and better evaluate small joints before determining final management
- Useful for intercarpal stabilization while performing ligament reconstructions (e.g. scapholunate ligament repair/reconstruction)

Dodson Modular Retractor

Designed to help expose a small to medium size bone for internal fixation—can be used for distal radius, ulna, humerus, and fibula fractures

Allows the limb to be rotated (pronated or supinated) without loss of exposure. The hohmann retractors have three hole sizes which allow for a variety of positioning angle options using the teeth of the self-retaining retractor, or can also be positioned in-between the teeth. The hohmann is placed around the bone, and thus reduces the force on the soft tissues while increasing exposure. Can be used in the forearm to treat radius and ulna shaft fractures, humerus fractures, as well as in the leg for fibula fractures.

Set consists of one self-retaining retractor, two stainless steel mini-hohmann retractor blades, and a sterilization case. Radiolucent mini-hohmann retractor blades are optional.

Wurapa Swivel Blade Forearm Retractor

Designed for forearm and wrist fracture exposure, the blades swivel for less stress on soft tissue

Swivel-blade technology helps to allow parallel deployment of retractor blades to maximize wound exposure and minimize edge loading on surrounding soft tissues. Parallel deployment of the retractor blades also helps prevent rotation and migration of the retractor during a procedure.

PRODUCT NO'S:
1646-00 [Set] *Includes Retractor and Two Swivel Blades*
Also available individually:

Williams Distal Radius Fracture Retractor

Designed to provide excellent exposure during fracture reduction and plating

Long straight arms allow parallel retraction of the incision, while the deep blades with a pronounced distal "curl" help maintain soft tissue retraction.

The solid, concave ulnar blade helps prevent soft tissue from being captured by the drill bit when drilling the ulnar holes, and helps to protect the median nerve and flexor tendons.

The radial side blade is a deep blunt tip Wietlaner-style.

Two .045" (1,1 mm) guidewire holes are attached to the arms just proximal to both blades. The holes are angled in slightly varying directions to allow choice of placement of stabilizing pins into the distal radius to prevent rotation or migration of the retractor.

Beard Distal Bicep Retractor

Designed to help optimize surgical exposure during anterior single incision distal biceps tendon reinsertion

The blade design features an anatomically contoured distal end to hug the radius cortex. The smooth distal end helps to avoid deep penetration, and the width matches the width of the distal biceps tendon insertion site. The narrow curved handle design helps to optimize workspace and visualization. Sold as a set, or available individually for replacement.

J.B. Redler Retractor

Uniquely balanced retractor for bone exposure for a multitude of upper extremity procedures

Double-angle design allows for ideal exposure with minimal effort to hold the retractor, while the assistant's hands are well out of the way of the exposure. The aperture in the base of the handle allows the retractor to be attached via a Penrose drain to the table for hands-free approach.

K-Wire Bender/Cutter

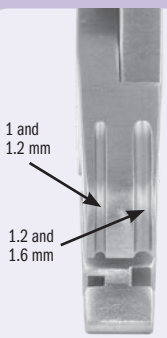
Designed to bend a K-wire while extending from bone without applying mechanical strain

The K-wire only needs to extend 20 mm from the skin surface to be bent.

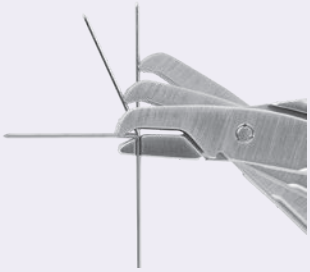
PRODUCT NO:
2111
Overall Length: 6.5" (16,5 cm)

USA MADE

Can bend and cut K-wires measuring 1 to 1.6 mm (.039-.062") in diameter



The right slot of the instrument's lower jaw can hold K-Wires with a diameter of 1.2 mm or 1.6 mm. The smaller left slot can hold K-Wires measuring 1 mm or 1.2 mm in diameter.



Bending

With the jaw of the instrument opened wide, the K-Wire is inserted from the side into one of the slots of the lower jaw. During bending, the K-Wire is forced backwards by the nose of the upper jaw and guided by a small groove.

Cutting

The K-Wire is inserted into the cutting groove and the bender/cutter cuts by shearing (like a cigar cutter), not crushing. The result is a clean and burr-free cut surface.

Wire Bender

Designed to bend wire up to .062"/1.6 mm

Cut-out for Screw
Provides a secure source of leverage against a temporarily placed 3.5 mm screw

Wixted Fracture Distractor

Designed to provide opposing leverage to help bring the fibula (or other bone) back out to its proper length after it has been shortened by a fracture

A 3.5 mm screw is temporarily placed above a plate, providing a source of leverage for the screw holding end of the distractor. The curved peg-shaped tip is then placed into a hole in the bone plate, and the distractor is activated to bring the bone back to its proper length before fixation.

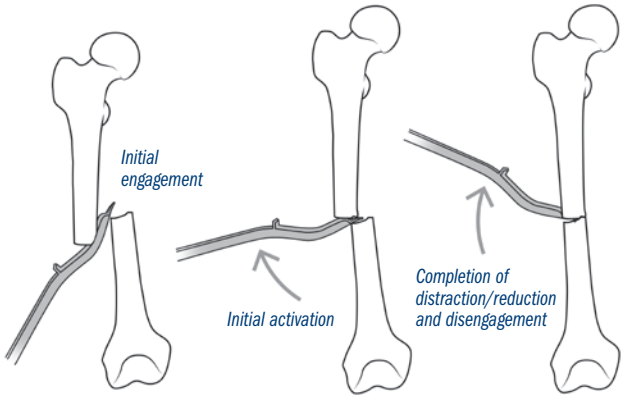
AK Fracture Reducer

Designed to help reduce long bone fractures of the femur and tibia, especially helpful with shortened long bone fractures due to young, strong musculature in acute trauma, or neglected fractures due to overriding circumstances or late referral



- The curved, serrated tip helps to wedge and hold the reducer in place
- The curved trough side of the reducer helps capture and control the bone while leverage is applied
- Once in place, by pushing on the T-handle, the surgeon uses the reducer to help move the bones into alignment for plating or rodding

Angled Lowman-Type Bone Clamp

Angled for easier insertion of the jaws around the bone

The offset distance between the jaws and handle of the clamp allow space for free and easy access to use a drill or screwdriver. The angled clamp and more-open and thinner jaws facilitate easier use in deep incisions. The angled shaft also acts as a self-retaining retractor. The tightening handle is scalloped to lessen slippage when tightening or untightening.

Chen Diaphyseal Fracture Reduction Clamp

Designed to facilitate and maintain reduction of the internal fixation of diaphyseal and meta-diaphyseal fractures of long bones

Works especially well with short oblique bones while providing room to implement the plate with this bone clamp still in place.

- Pivoting pads accommodate metaphyseal fractures
- The quick release enables adjustment without losing reduction
- Helps provide provisional reduction of diaphyseal fractures – humeral shaft fractures, tibial fractures

PRODUCT NO:
1808 *Overall Length: 9.25" (23,5 cm)* *Arm Downward Offset: 15 mm* *Pad Dimensions: 1" x .375" (25,4 cm x 1 cm)*

Durham Bone Reduction Clamps

Allows application of a bone plate without removing the reduction clamp

The large clamp with speedlock is designed for large bones such as the femur and tibia. See page 142 for standard clamp version.

The wide window directly above the jaws provide space to allow a bone plate to be slid into position without removing the clamp.

PRODUCT NO'S:
3652 [Standard] *Overall Length: 7.375" (18,7 cm)*

Bargo Bone Holding Clamp

Designed to aid in the reduction of various fractures, and can help secure a plate in place

For fractures such as: spiral, transverse, compound, oblique, or butterfly. Can also be used to secure a plate in place while the screw holes are being drilled and screws inserted. The fracture site can also be manipulated with the clamp being used as a lever. The teeth in the jaws allow for a better grip and the ratchet locking handle allows for use on various bone diameters.

PRODUCT NO:

O'Brien Bone Clamps

Designed for use in stabilization of a fracture or osteotomy

Allows for placement of the bone clamp where it can best stabilize bone fragments. The drill guide allows for screw placement through the top of the clamp. Calibrations on the handle help eliminate the use of a depth gauge.

Integrated drill guide and bone diameter gauge

PRODUCT NO'S:

Ratcheting Reduction Clamp Kit

Designed as a soft tissue sparing fracture reduction clamp

- High torque can help provide bone and joint reduction without squeezing surrounding tissues
- Swivel points are placed on the bone, plate, or screw and the ratcheting dial is turned to the desired torque, allowing hands free operation
- Swivel point design allows the clamp to be easily moved from x-ray view without losing reduction
- Screw Point fits into a screw head
- Plate Point fits into a 3.5 mm plate hole

Kit includes: (1) Ratcheting Reduction Stationary Arm, (1) Ratcheting Reduction Mobile Arm with Ratchet Knob (1) Plate Point, (1) Screw Point, and (2) Percutaneous Points

PRODUCT NO'S:
3840-00 [Clamp Kit]
Also available Individually:

Sarraf Fracture Reduction Thimble

Helps hold bone fragments in place during fixation

Helps to maintain a fracture fragment in the appropriately reduced position during application of K-wires. Helpful in osteoperotic bone that is not amiable to forced reduction using reduction clamps. The wire guides help to aim the K-wire, with three positions for choice of optimal placement and for parallel wire placement. The pointed tips at the end of the thimble help to reduce the chance of slippage while maintaining a fracture reduction.

PRODUCT NO'S:
2290 [22 mm] *Overall Length: 1.185" (3 cm)* *Guides Accept K-wires Up To: .078" (2 mm)*

Stanton Nail/Screw Drill Guide Assembly

FOR DISTAL HUMERAL, FEMORAL, OR TIBIAL SCREWS

Designed to help hold and stabilize a drill guide, allowing the surgeon to obtain 'perfect circles' and drill distal locking screw holes without exposure of the hand to the x-ray beam

The drill guide unit (sleeve/trocar) is placed over the side of the bone through an incision. The locking holder is attached to the guide and rested against the skin for stability. With the x-ray on, the guide unit is adjusted by moving the holder until the trocar lines up with the hole in the rod. The trocar is removed and a drill bit is then inserted into the guide.

PRODUCT NO'S:
8986-00 [Assembly Set] *Set includes: (1) Holder, (1) Sleeve, and (1) Trocar*
Also available individually:

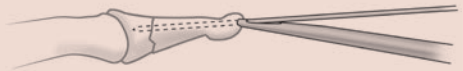
TWO SIZES AVAILABLE:
Wire Hole for K-wires up to 1.1 mm (.045") or 1.6 mm (.062")

Resnick Small Bone Tamp with Oblique K-Wire Hole

Design allows for the concurrent reduction of a fracture and placement of a wire into the fracture site – especially helpful when the surgical exposure is small and tight, the fracture fragments are small, and the reduction is demanding



- Allows the ability to place Kirschner wires into fracture sites
- The serrated distal end minimizes slippage on the cortical surface, does not interfere with the placement of the guidewire and allows for subsequent surgeon-decided, intraoperative angulation of the wiring once the first cortex is drilled
- Especially useful in fractures where there is involvement of an articular surface, for example, mallet fractures of the distal phalanx, articular fractures that involve ligamentous attachments or tendon attachments of the phalanges, scaphoid pole small fracture fragments or other small carpal fractures, and radial styloid fractures

PRODUCT NO:
5294 *Wire Hole for: 1,25 mm (.045") K-wire* *Overall Length: 7.5" (19,1 cm)* *Shaft Diameter: 6,3 mm* *End Diameter: 2,5 mm*

Whelan Double-Ended Suture Wire Passer

Passer guide and malleable passer designed to pass suture wires around a bone

The passer guide is placed around the bone, and the thin malleable passer is inserted at the handle end and follows the grooved passer around. The suture wire (up to 18 gauge) is attached to the keyholed end of the passer, which can then be reversed out of the passer, drawing the suture wire around the bone.

PRODUCT NO'S:

Distal Humerus Fracture Board

Designed for the pinning of pediatric supra-condylar and adult distal humerus fractures

Allows the surgeon to pin these fractures without having to manually hold the fracture reduced, allowing the surgeon to focus on accurate pin placement and reduction. The height of the crossbar is fully adustable to accommodate different size patients. Reduction is acheved by an assistant gently applying axial traction through the forearm, with the crossbar applying the counter traction. Pinning is done with the C-arm in the lateral position. An optional separate attachment to support the arm for distal humerus fractures in adults is available. Unit not sterilizable.

PRODUCT NO'S:
2445 [Fracture Board – Pediatric] *Main Board Dimensions: 22" x 12" (55,8 cm x 30,5 cm)* *Crossbar Height Adjusts From: 4.5" to 7.5" (11,4 cm x 19,1 cm)*

Fromm Femur & Tibia Triangles

Used for femur and tibia positioning during nailing, repairs and fractures

Designed to position and hold the femur and tibia during intramedullary nailing of the tibia, ligament repairs and extremity fractures. Allows knee to be flexed greater than 90° to allow reaming and nail insertion without displacing fracture. The triangles are available in four heights: 8.5", 11", 14", and 16". The three smaller triangles are designed to fit inside the larger triangle for storage. They are supplied with an autoclavable silicone cushioning pad and velcro* straps. The triangles are radiolucent and gas or steam sterilizable.

Sanders Extremity Positioning Tubes

Designed to support the knee and ankle during lower extremity surgery

The 6" tube lifts the knee off the operating table and allows for approximately 30° of knee flexion. Very useful for closure of total knee incisions, supporting fractures of the distal femur, and tibia plateau fractures. The 4" tube elevates the foot and ankle for ankle fracture surgery. The tubes are made of aluminum, allowing them to be autoclaved. They help eliminate the need for rolled sheet bolsters.

Universal Bone Grafting/ Impacting Forceps

Bone graft can be grasped, placed & impacted without changing hands or instruments

Designed with grasping ends for delivery of bone graft. When the graft is in place, the forceps are closed, which forms the ends into an impacting punch. A striking platform forms the end of the forceps for tapping and tamping the graft. Four end diameters are available in two lengths.

Modular Impactor Set

Makes multiple impactor heads easily visible and available

Designed to have available to the operating surgeon multiple types of impactors utilizing one handle. The rack uses less space and allows the surgeon to quickly see the designs available. The impactors are supplied with stainless steel tips for bone and delrin tips which can be used against an implant for slight placement adjustments.

GENERAL USE

Cheng Biopsy Trephine System

Cannulated T-handle and trephines allow use of a standard 1.6 mm (.062") threaded K-wire to help facilitate grasping and removal of a core bone sample for biopsy or core decompression

Designed for use with a standard 1.6 mm (.062") threaded K-wire (not included).

- Allows use of trephine at oblique angles to bone surface by using an anchoring K-wire and cannulated trephine
- Avoids "skipping" of trephine teeth on bone surface
- Facilitates optimal approach angle and direction of trephine
- Variety of core diameters yields bone samples of sufficient size for pathology
- Adapters allow for use of a power drill
- Minimally invasive – soft tissue sleeve protects surrounding structures and tissue
- Can also be used for bone graft harvesting
- Repositioning guide allows easy adjustment of targeting K-wire

GENERAL USE

Stanton Needle Driver

Allows a heavy cutting needle such as an OS-6 to be pushed through cancellous bone when re-attaching muscle or tendon

The groove captures the outer (convex) side of the needle and prevents the needle from spinning even when applying significant pressure. Useful for reattaching the rotator cuff in rotator cuff repairs, as well as in attaching suture anchors.

Suture Cutter

Needle Holder

Bates Needle Holder with Suture Cutter

By trapping the suture and cutting when the forcep is opened, helps to reduce stress on the surgeon's hand

- No switching between needle driver and scissors, or need for assistant to cut sutures for you
- Cutting with opening of forceps reduces possibility of damage to surrounding tissues
- Sliding the instrument down to the suture knot allows quick and consistent 2 mm suture tails
- Slip the suture strands into the suture cutting slot and slide the closed instrument along until desired length of tail is achieved, then open the instrument to cut the sutures

Radiation Attenuating Surgical Gloves

Powder-free gloves provide increased protection from direct x-ray beam and scattered radiation

Reduced Exposure
Lead-free, surgical gloves attenuate direct or scattered rays and are an environmentally friendly alternative to leaded gloves.

Freedom of Movement
Gloves are very thin—ONLY 0.007" THICK—to allow the greatest possible flexibility, dexterity, and sensitivity of touch while decreasing finger fatigue.

Natural Latex Free & Powder-Free
Reduced risk of natural rubber latex allergies.

Quality Guaranteed
All gloves are 100% tested for pin holes and leaks.

Applications
Fluoroscopy, Orthopedics, Radioisotope Handling, Cardiology, Radiology, Dental, Nuclear Medicine

Average Radiation Attenuation Levels Measured in the Direct Beam

Beam Quality	Aluminum Half Value Layer	Measured Attenuation
60 kVp	HVL = 2.3 mm	58.7%
80 kVp	HVL = 3.3 mm	49.9%
100 kVp	HVL = 4.3 mm	44.6%
120 kVp	HVL = 5.6 mm	40.6%

NOTE: Double gloving with conventional latex surgical gloves provides only 1% attenuation.
Levels are measured by a fixed filter equivalent: 2.5 mm Al
